

ABSTRACT

[0061] An electrically conductive quick connector housing is matingly engagable with an electrically conductive male endform. An electrically conductive contact member is mounted in the bore of the housing and has an arm extending from a mounting portion which is engagable with the male endform when the male endform is inserted into the housing to electrically connect the male endform to the housing. The mounting portion is in the form of a tubular body or an annular ring. In the case of the annular ring, angular fingers project from the ring for engagement with the housing.
